

Lift Tutorial: Applications

Writing an Application

General Steps

- Determine input parameters
- Initialise input data
 - If testing, initialise comparison data
- Craft or translate the algorithm of interest
- Create an OpenCL kernel from your algorithm

Data Input to Lift Algorithms

- Lift can take in arrays or scalars as input parameters

```
val liftLambda = fun(
  ArrayType(Float, SizeVar("N")),
  ArrayType(Float, weights.length),
  ...
)
```

- Single entry point for arrays into functions
 - Multiple arrays can be zipped together (but must be the same size!)

```
fun(neighbourhood) =>
{
  ...
  $ Zip(weights,neighbourhood)
}
```

Initialising Data in Scala

- Create arrays of data to pass into Lift algorithms in Scala

```
val stencilValues = Array.tabulate(nx,ny,nz) { (i,j,k) => (i + j + k + 1).toFloat }
```

- Our examples are all in unit tests, which include data to compare against - often from the same algorithm in Scala

```
assertEquals(dotProductScala(left,right), output.sum, 0.0f)
```

Developing an Algorithm

The goal is not for Lift to be programmed in directly.

However, functionality for new types of algorithms must be added in and tested. In doing so, there are a few things to keep in mind:

- Lift allows multiple inputs, but there is only one data entry point to the main algorithm (can contain tuples)
- The algorithm itself must eventually map values back to global memory
- The result will be returned in a single array (however, this array can also contain tuples)

Simple Example: 1D Jacobi Stencil

```
val jacobi1Dstencil = fun(
  ArrayType(Float, N),
  (input) => {
    Map(Reduce(add, 0.0f)) o
    Slide(3, 1) o
    Pad(1, 1, clamp) $ input
  }
)
```

Creating an OpenCL kernel

- To compile your Lift kernel to OpenCL, run
[opencl.executor]Compile(<kernel>)
 - This kernel can then be saved as a string or file

```
Compile(lambda)
```

- To execute the kernel straight away (compiling will happen behind the scenes), run
[opencl.executor]Execute(<options>)[Array[type]](lambda, ..inputs..)

```
val (output, runtime) = Execute(inputData.length)[Array[Float]](stencilLambda, inputData, stencilWeights)
```

Detailed Example: Matrix-Matrix Multiplication

Matrix-Matrix Multiplication Overview

- Widely used algorithm in mathematics, physics, engineering, etc
- Range of possible optimisations can be used, the performance of which varies across architectures
- Lift makes it easy to test these optimisations out without having to rewrite the original code

Matrix-Matrix Multiplication Example Code

```
val MMmultiply = fun(
  ArrayTypeWSWC(ArrayTypeWSWC(Float, K), M),
  ArrayTypeWSWC(ArrayTypeWSWC(Float, K), N),
  (matA, matB) => {
    Map(fun( Arow =>
      Map(fun( Bcol =>
        Map(id) o Reduce(add, 0.0f) o Map(mult) $ Zip(Arow, Bcol)
      )) $ matB
    )) $ matA
  })
}
```

Matrix-Matrix Multiplication Using Rewrites

A * B =

$\text{Map}(\overrightarrow{\text{rowA}} \mapsto$
 $\text{Map}(\overrightarrow{\text{colB}} \mapsto$
 $\text{DotProduct}(\overrightarrow{\text{rowA}}, \overrightarrow{\text{colB}})$
 $) \circ \text{Transpose}() \$ \mathbf{B}$
 $) \$ \mathbf{A}$

80 rewrites 

$(p239, p36 \mapsto$
 $\text{Join}() \circ \text{Map}(p179 \mapsto$
 $\text{Transpose}() \circ \text{Join}() \circ \text{Map}(p70 \mapsto$
 $\text{Transpose}() \circ \text{Join}() \circ \text{Map}(p20 \mapsto$
 $\text{Transpose}() \circ \text{Map}(p65 \mapsto$
 $\text{Transpose}()(p65)$
 $)) \circ \text{Transpose}()(p20)$
 $)) \circ \text{Transpose}() \circ \text{Reduce}(p75, p0 \mapsto$
 $\text{Map}(p164 \mapsto$
 $\text{Join}() \circ \text{Map}(p81 \mapsto$
 $\text{Reduce}(p136, p90 \mapsto$
 $\text{Map}(p163 \mapsto$
 $\text{Get}(0)(p163) + \text{Get}(1)(p163) * \text{Get}(1)(p90)$
 $)) \circ \text{Zip}(2)(p136, \text{Get}(0)(p90))$
 $)(\text{Get}(0)(p81), \text{Zip}(2)(\text{Transpose}() \circ \text{Get}(1)(p164), \text{Get}(1)(p81)))$
 $)) \circ \text{Zip}(2)(\text{Get}(0)(p164), \text{Get}(1)(p0))$
 $)) \circ \text{Zip}(2)(p75, \text{Split}(blockFactor) \circ \text{Transpose}() \circ \text{Get}(0)(p0))$
 $)(\text{Zip}(2)(\text{Split}(sizeK) \circ \text{Transpose}()(p179), p70))$
 $)) \circ \text{Transpose}() \circ \text{Map}(p4 \mapsto$
 $\text{Split}(sizeN) \circ \text{Transpose}()(p4)$
 $)) \circ \text{Split}(sizeK)(p36)$
 $)) \circ \text{Split}(sizeM)(p239)$
